Thinking with Models _ Linear Inequality

Visible Thinking: Claim Evidence Reasoning

Claim	Evidence	Reasoning
<p>The solution to the inequality $5 - 6x > -19$ is $x < 4$</p>	$5 - 6x > -19$ $-6x > -19 - 5$ $-6x > -24$ $x < \frac{-24}{-6}$ $x < 4$ 	<p>if $x = 3$ then $5 - 6(3) > -19$ $5 - 18 > -19$ $-13 > -19$ Confirming the claim</p> <p>Note: When multiply & divide by a negative, the direction of inequality reverse.</p>
